

The Power of Data Analytics in Your Email Investigations

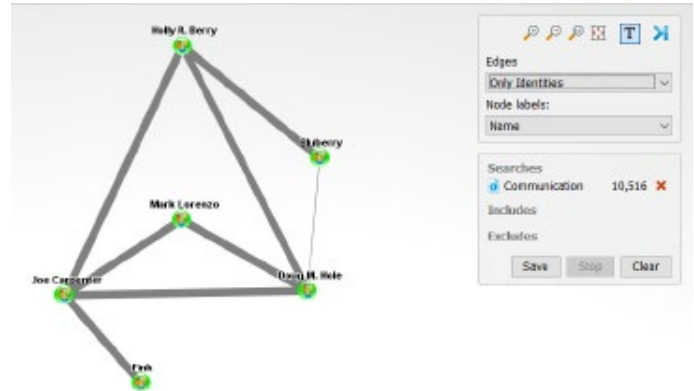

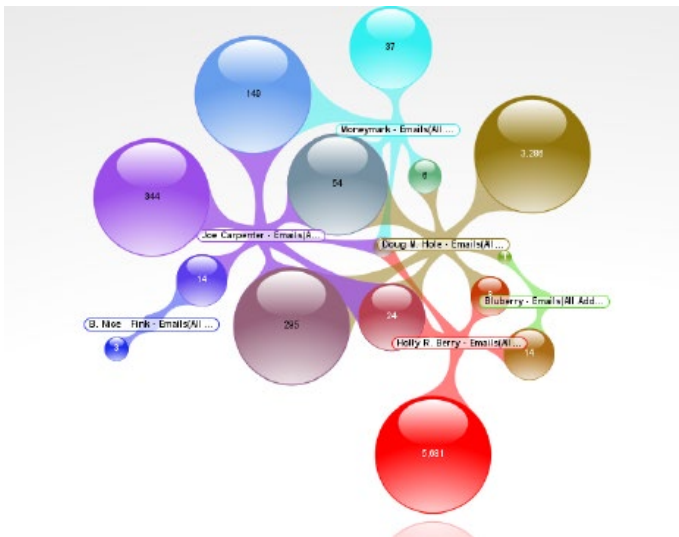

What is Data Analytics?

Process of examining, transforming and modeling data to recognize useful information and to support decision making

- Identify relevant data quickly
- Form links between the data

Analytics can be used at various stages:

- Early Case Assessment
- Data Culling
- Relevancy Review

Workflow

1. Using the Identity feature group people's communication aliases into a single identity
 - Email Addresses
 - Chat Handles
2. Plot the results on the cluster map
3. Review outer clusters to identify additional people of interest
 - Create additional identities if required
4. Use the social graph to get a better visual representation of the communication links

Data Analytics in Email Investigations

Most investigations today contain some form of email data

- Often full mailbox dumps

Manually sifting through emails to find communication links is time-consuming and inefficient

We can use Intella's features to chart email communications

- Identities
- Cluster Map
- Social Graph
